

# Data Loss Prevention (DLP) Policies for external devices

## Windows VM – Blocking USB

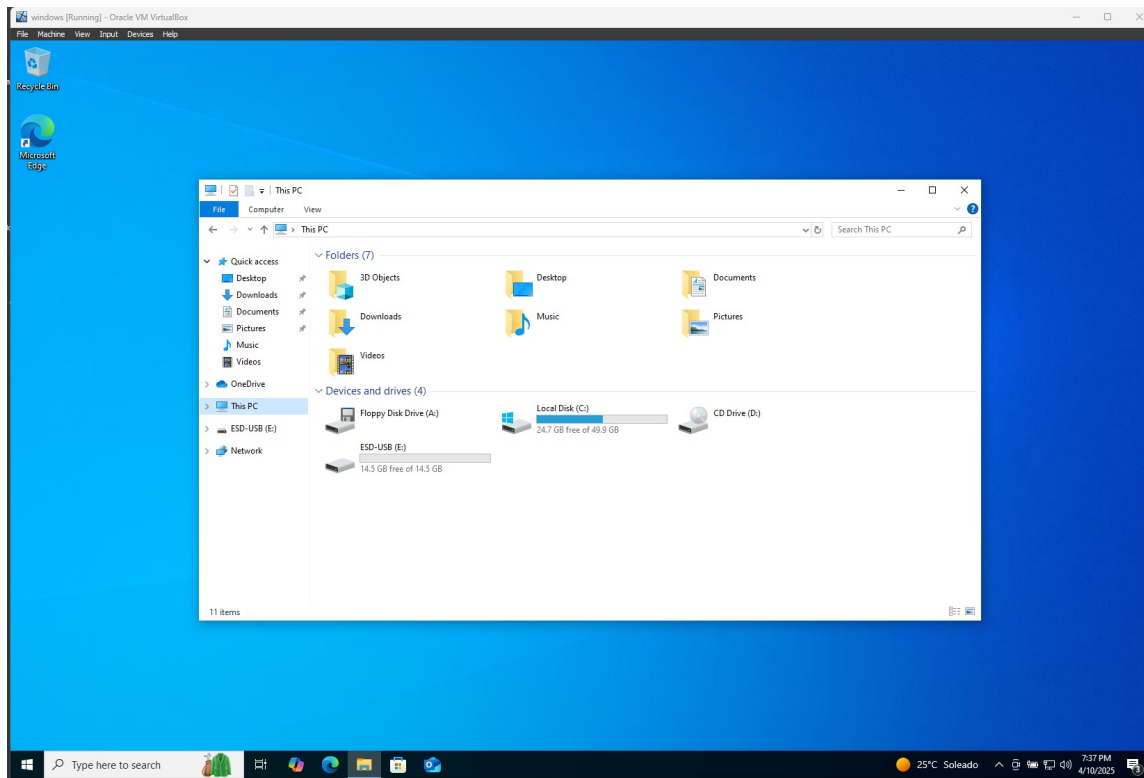

1- First we begin to install the extension on Virtualbox

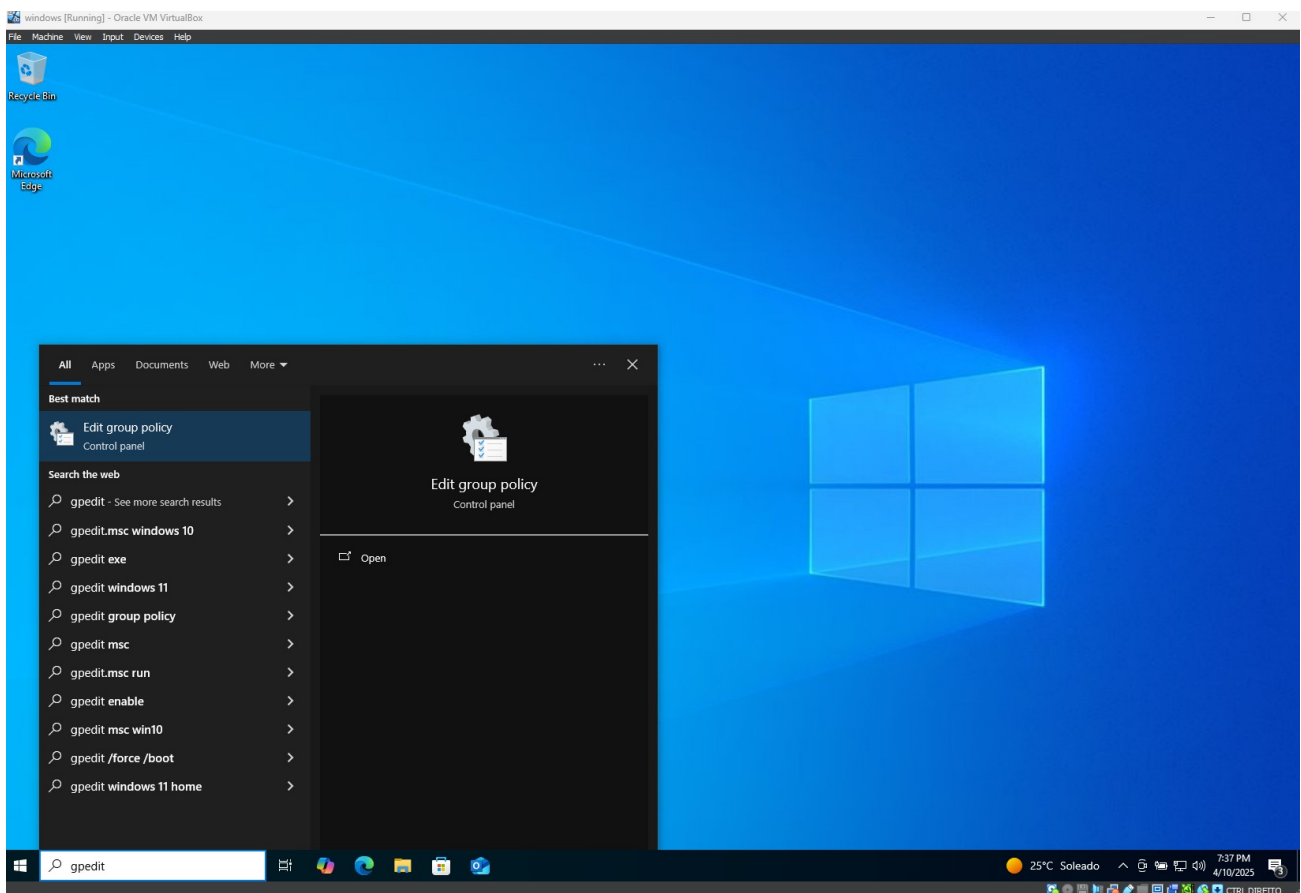

2 – Verify if you have access to select the USB

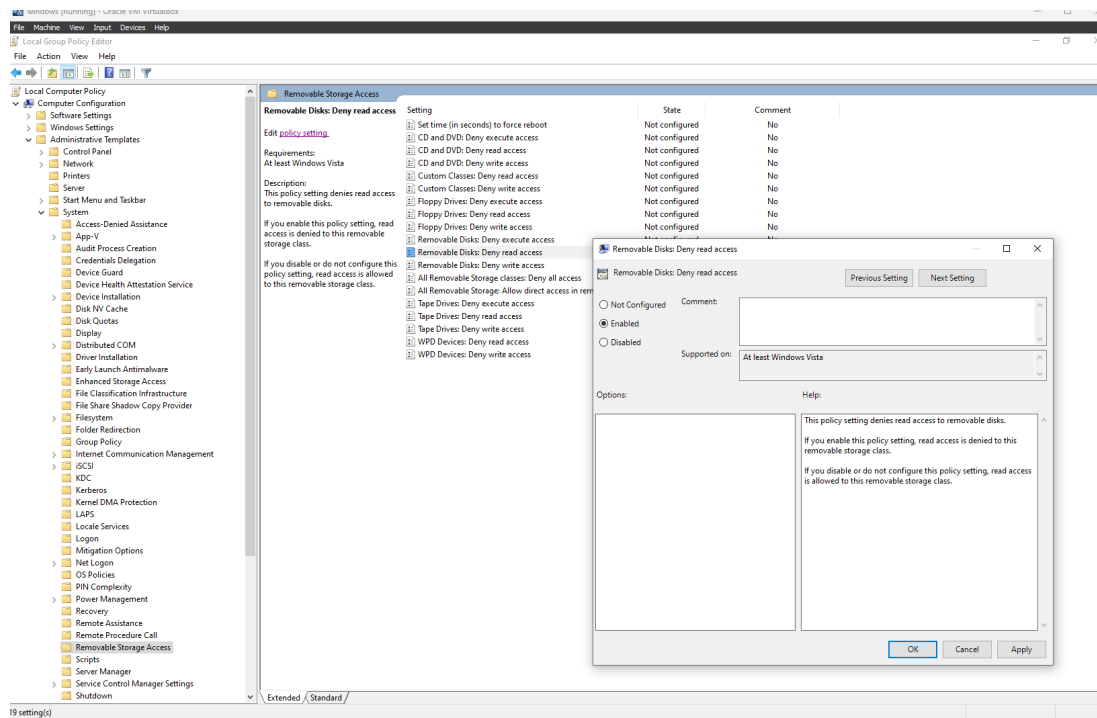

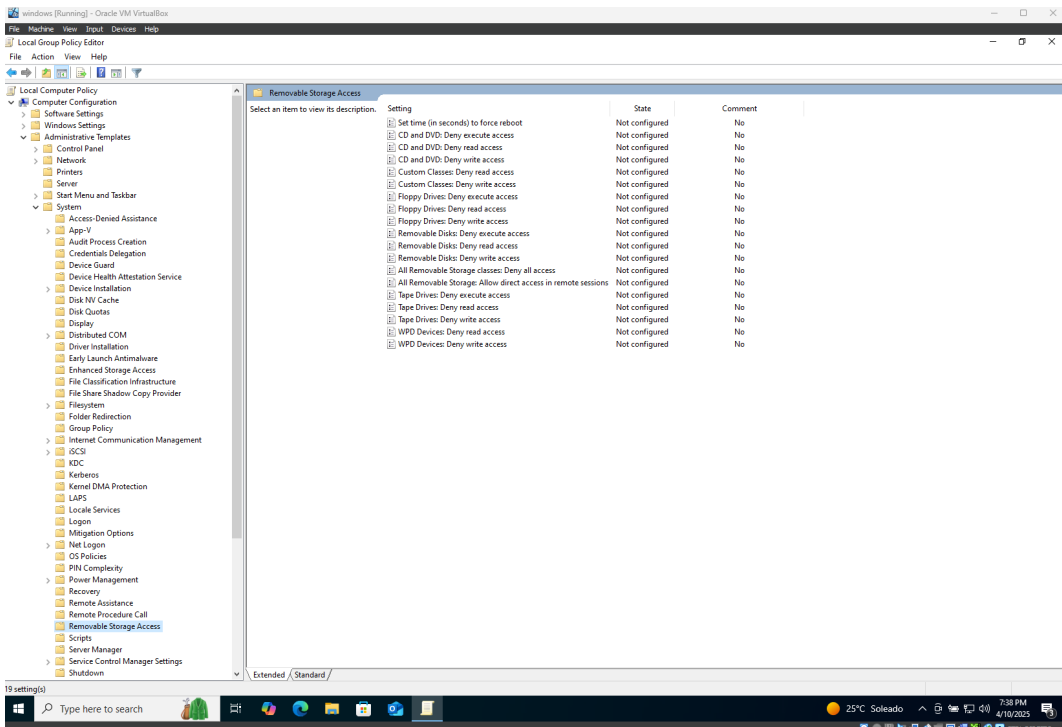

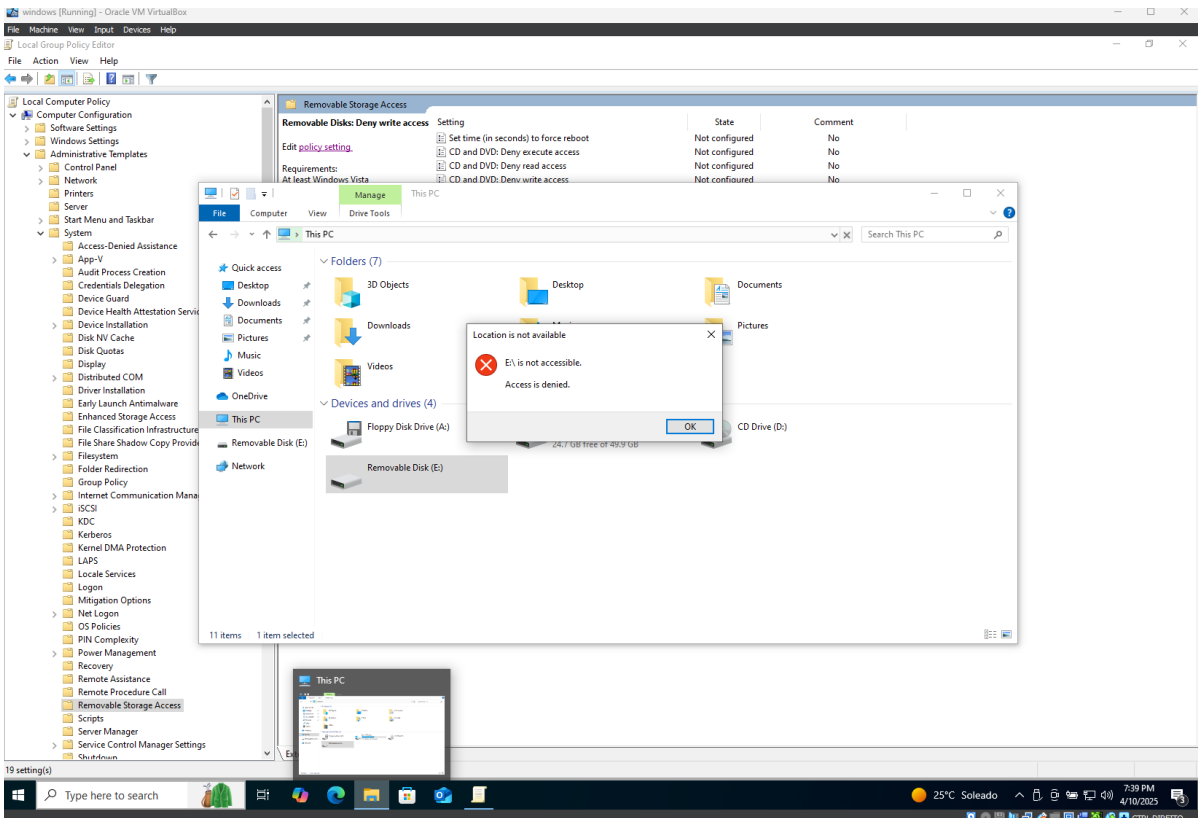

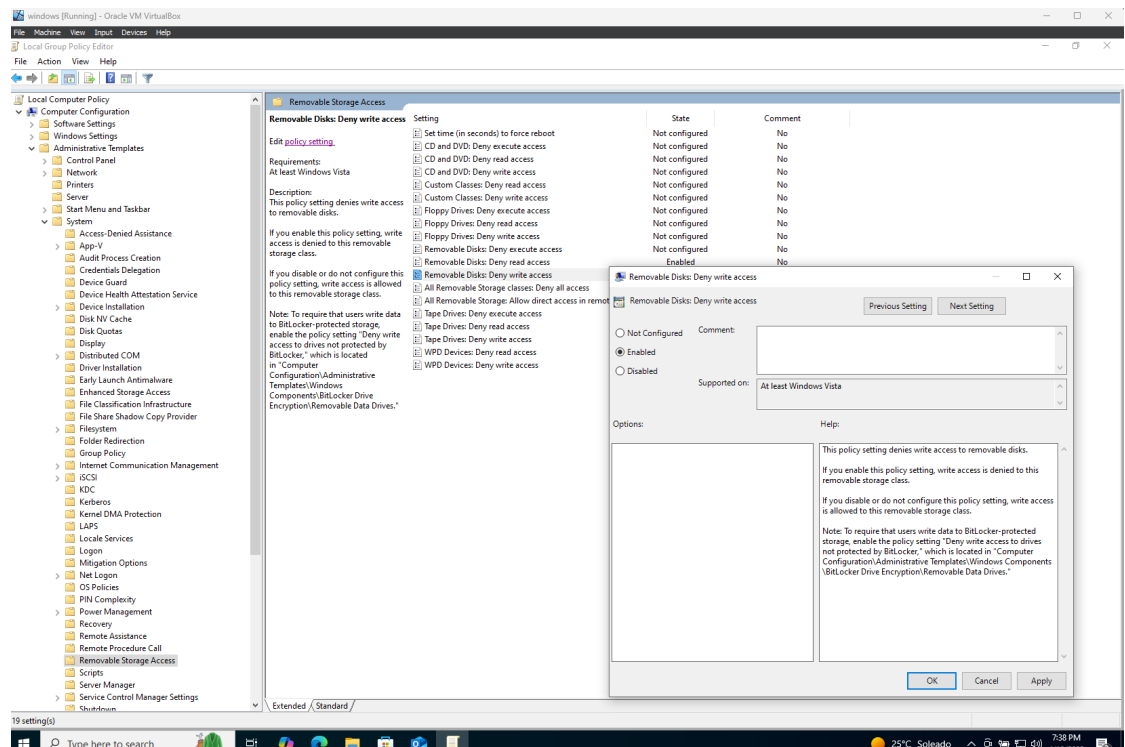

### 3 – Select the USB and verify if you can access the USB in the VM

### 4 – Begin the process to block the access to USB at the Device level

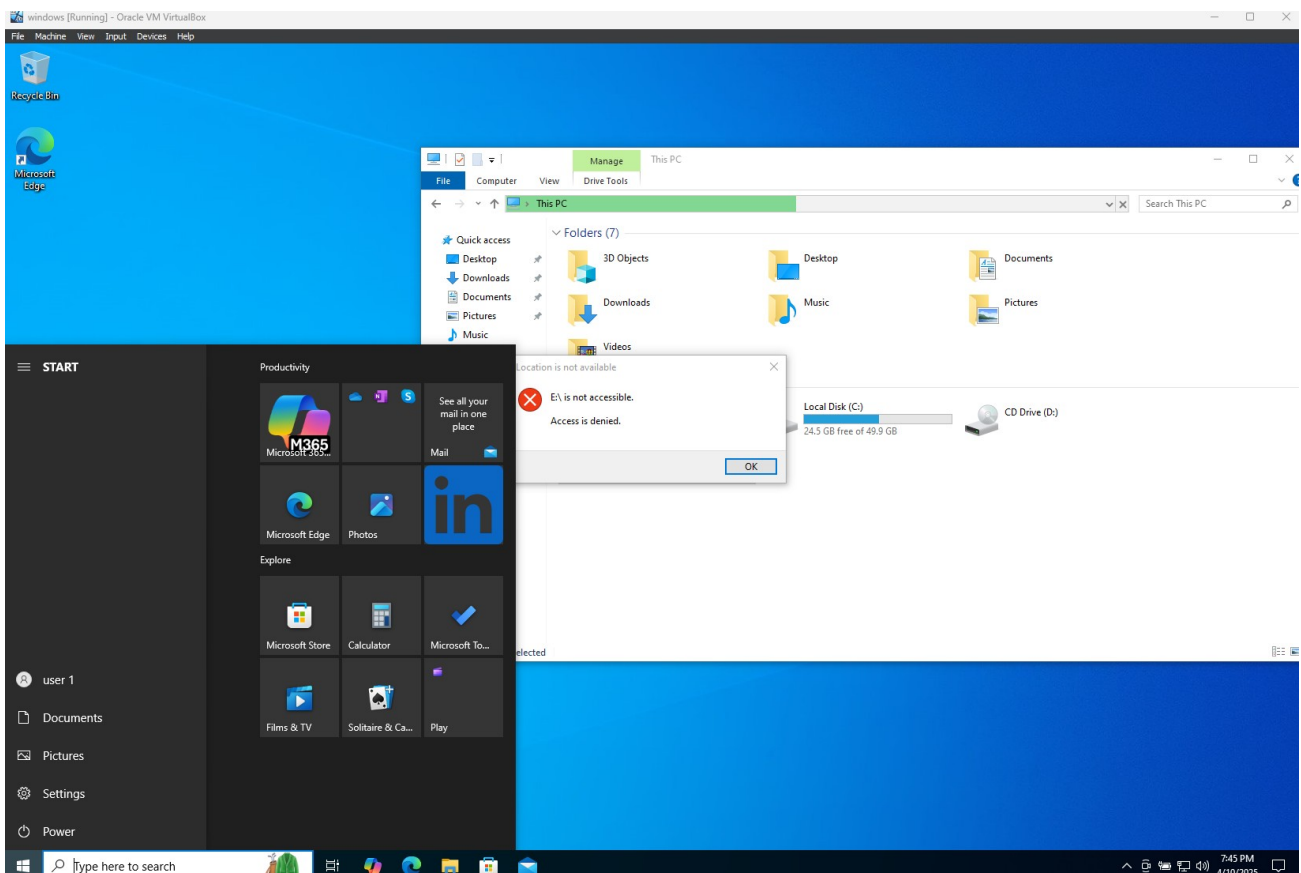

This action will block the access to the USB at the Machine level even if you create other users it will block them.

Below the images of the other user that was requested to be created

Now related to the Exceptions for specific user that ones need to be done at Group policy at server level since if you configure at local level all the users that will access that machine will have the same permission, and at user level it does not allow to give exceptions to every user.
